

# Burrows-Wheeler Transform and Suffix Arrays

Pavel Pevzner

Department of Computer Science and Engineering  
University of California at San Diego

**Algorithms on Strings**  
**Data Structures and Algorithms**

This slide deck is incomplete.  
For the complete set of frames,  
please see our videos in the  
[Algorithms on Strings](#) course on [Coursera](#)  
([Algorithms and Data Structures](#) Specialization)

# Outline

- **Burrows-Wheeler Transform**
- Inverting Burrows-Wheeler Transform
- Using BWT for Pattern Matching
- Suffix Arrays
- Approximate Pattern Matching

# Text Compression by Run-Length Encoding

- **Run-length encoding** compresses a run of  $n$  identical symbols:

*Text*

GGGGGGGGGGCCCCCCCCCCCCAAAAAATTTTTTTTTTTTTTTTTTTTCCCCCG

↓

10G11C7A15T5C1G

- genomes don't have lots of runs... but they do have lots of repeats:

ACTGACCGAACTGAGTATCCGACTGAACTGATCAGTACTGACATTGC

# Idea: Converting Repeats to Runs

- Sorting gives us the first 6 columns of the matrix.

# Reconstructing banana

- We now know 6-mer composition of the circular string banana\$
- Sorting gives us the first 6 columns of the matrix.

# Reconstructing banana

\$banana  
a\$banan  
ana\$ban  
anana\$b  
banana\$  
na\$bana  
nana\$ba

- We now know the entire matrix!

# Reconstructing banana

**\$banana**

a \$ b a n a n

a n a \$ b a n

a n a n a \$ b

b a n a n a \$

n a \$ b a n a

n a n a \$ b a

- We now know the entire matrix!
- Symbols in the first row (after \$) spell **banana**.

# More Memory Issues

- Reconstructing *Text* from  $BWT(Text)$  required us to store  $|Text|$  cyclic rotations of  $|Text|$ .

```
$b a n a n a  
a $b a n a n  
a n a $b a n  
a n a n a $b  
b a n a n a $  
n a $b a n a  
n a n a $b a
```

- Can we invert  $BWT(Text)$  with less space and without  $|Text|$  rounds of sorting?

# Three Matches of **na** Found!

- Searching for a**na** in panamabananas

The diagram illustrates the search for the substring "na" within the string "panamabananas". It shows a grid of substrings of length 3, with the matches highlighted in green. Three green arrows point from the matches to their positions in the grid.

# Searching for **ana** using *top* and *bottom* pointers

*topIndex* ← first position of symbol among positions from *top* to *bottom* in *LastColumn*

*bottomIndex* ← last position of symbol among positions from *top* to *bottom* in *LastColumn*

# BWMatching

```
BWMATCHING(FirstColumn, LastColumn, Pattern, LASTTOFIRST)  
  top  $\leftarrow$  0  
  bottom  $\leftarrow$  |LastColumn| - 1  
  while top  $\leq$  bottom  
    if Pattern is nonempty  
      symbol  $\leftarrow$  last letter in Pattern  
      remove last letter from Pattern  
      if positions from top to bottom in LastColumn contain symbol  
        topIndex  $\leftarrow$  first position of symbol among positions from top to bottom  
          in LastColumn  
        bottomIndex  $\leftarrow$  last position of symbol among positions from top to  
          bottom in LastColumn  
        top  $\leftarrow$  LASTTOFIRST(topIndex)  
        bottom  $\leftarrow$  LASTTOFIRST(bottomIndex)  
      else  
        return 0  
    else  
      return bottom - top + 1
```

Given a symbol at position *index* in *LastColumn*,  
**LastToFirst**(*index*) defines the position of this symbol in *FirstColumn*

# BWMatching is slow:

it analyzes every symbol from *top* to *bottom* in each step!

if positions from *top* to *bottom* in *LastColumn* contain symbol  
*topIndex*  $\leftarrow$  first position of symbol among positions from *top* to *bottom*  
in *LastColumn*  
*bottomIndex*  $\leftarrow$  last position of symbol among positions from *top* to  
*bottom* in *LastColumn*

# Introducing *Count* Array

# Constructing Suffix Array

- Depth-first traversal of suffix tree
  - $O(|Text|)$  time and  $\sim 20 \cdot |Text|$  space
- Manber-Myers algorithm (1990):
  - $O(|Text|)$  time and  $\sim 4 \cdot |Text|$  space
- But memory footprint is still large for human genome!

We will learn how to quickly construct suffix array  
without relying on suffix tree later in this course

# Reducing Memory Footprint for Suffix Array

- Can we store only a fraction of the suffix array but still do fast pattern matching?

# Outline

- Burrows-Wheeler Transform
- Inverting Burrows-Wheeler Transform
- Using BWT for Pattern Matching
- Suffix Arrays
- **Approximate Pattern Matching**

# Returning to Search for Mutations

- **Approximate Pattern Matching Problem:**
  - **Input:** A string *Pattern*, a string *Text*, and an integer  $d$ .
  - **Output:** All positions in *Text* where the string *Pattern* appears as a substring with at most  $d$  mismatches.

# Revealing Mutations by Analyzing **Billions** of Reads

- **Multiple Approximate Pattern Matching Problem**
  - **Input:** A **set** of strings *Patterns*, a string *Text*, and an integer  $d$ .
  - **Output:** All positions in *Text* where a string from *Patterns* appears as a substring with at most  $d$  mismatches.

# BWT Pattern Matching with 1 Mismatch

- searching for **ana** in panamabananas

	# Mismatches
\$ <sub>1</sub> panamabananas <sub>1</sub>	
a <sub>1</sub> bananas\$panam <sub>1</sub>	
a <sub>2</sub> mabananas\$pan <sub>1</sub>	
a <sub>3</sub> namabananas\$p <sub>1</sub>	
a <sub>4</sub> nanas\$panamab <sub>1</sub>	
a <sub>5</sub> nas\$panamaban <sub>2</sub>	
a <sub>6</sub> s\$panamaban <sub>3</sub>	
<b>b</b> <sub>1</sub> <b>a</b> nanas\$panam <b>a</b> <sub>1</sub>	<b>1</b>
<b>m</b> <sub>1</sub> <b>a</b> bananas\$pan <b>a</b> <sub>2</sub>	<b>1</b>
<b>n</b> <sub>1</sub> <b>a</b> mabananas\$p <b>a</b> <sub>3</sub>	0
<b>n</b> <sub>2</sub> <b>a</b> nas\$panamab <b>a</b> <sub>4</sub>	0
<b>n</b> <sub>3</sub> <b>a</b> s\$panamaban <b>a</b> <sub>5</sub>	0
<b>p</b> <sub>1</sub> <b>a</b> namabananas <b>\$</b> <sub>1</sub>	<b>2</b>
s <sub>1</sub> \$panamabanana <sub>6</sub>	

This row results in a 2nd mismatch (the \$), so we discard it.
